Data Content Standards

Keith W. Boone
GE Healthcare

Data Content Standards

- Key concepts
- Features of terminology systems
- Terminologies in use today
- Tools and technologies

Objectives

- By the end of this session, you should be able to:
 - Define key concepts related to data standards
 - Describe features of various terminology systems
 - List several common terminologies used in health care IT and explain for what they are used

JOHNS HOPKINS
UNIVERSITY

Section A

Key Concepts

Key Concepts

- Concept
 - An idea represented or identified by a code
- Code
 - A unique string identifying an idea
- Coding system
 - A collection of codes associated with concepts
- Vocabulary/terminology
 - A collection of words and phrases; in the health care IT context, these are associated with codes
- Ontology
 - An exhaustive organization of knowledge about particular entities and their relationships within a particular domain

Key Concepts

- Primary term/preferred term
 - The word or phrase best representing a concept in a coding system
 - Usually the most common or more accurate
- Alternate term
 - A synonymous phrase representing a concept in a coding system
 - Less common or accurate than the preferred term, may link to multiples
 - For example, *MI* for *myocardial infarction* and *mental illness*

Key Concepts

- Hypernym
 - A more generic term or abstract concept
 - *Ball* is a hypernym of *football*
- Hyponym
 - A more specific term
 - *Soccer ball* is a hyponym of *ball*

Key Concepts

- Subsumption
 - The code for a hypernym contains all and codes for all (subsumes all) of its children

- Pre-coordination
 - A pre-coordinated concept is one in which all features of the concept are identified by a single code
 - For example, LOINC codes are all pre-coordinated

- Post-coordination
 - Terminologies supporting post-coordination allow for multiple codes from the coding system to be used to define concepts not explicitly listed in that system

Key Concepts

- Value set
 - A collection of codes from one or more coding systems representing a fixed set of ideas which concretely defines a concept domain

- Concept domain
 - The definition of a set of codes representing a particular collection of related ideas
 - An abstraction used in HL7 Version 3 to describe the purpose or function of a value set or coding system and to constrain the codes used in communication

Key Concepts

- Hierarchy
 - Referring to the structure of a coding system where each concept has at most a single hypernym or higher-level concept
- Polyhierarchy
 - Referring to the structure of a coding system where each concept can be related to more than one higher-level concept
- Cross-walk
 - A set of equivalence relationships between codes in different coding systems
 - Usually supporting mapping on one direction only
- Terminology service
 - An application providing programmatic access to codes and terms from one or more coding systems

Best Practices

- Versioning (configuration control)
 - Code systems must be maintained, and changes must be traceable, to a given version of the code system used

- Codes are *never* reused
 - If in 2009 code X meant A, and in 2010 it meant B, systems assuming X meant B would interpret the code incorrectly
 - Best practice is that codes are never reused to prevent this from occurring
 - This practice has not always been applied to ICD-9-CM

Best Practices

- Terms and phrases have a definition
 - Short phrases and single terms don't always have an agreed-upon definition
 - Consider *diabetes*
 - ▶ Does it include Type I and Type II?
 - ▶ What about gestationally induced?
 - ▶ What about other pancreatic disorders that are treated similarly?

Best Practices

- Codes for *other* not present
 - NOS: *not otherwise specified*
 - ▶ Used in some coding systems to create a code for a general case where specific details required for further classifying the idea being coded have not been provided, and so a more detailed code cannot be given
 - NEC: *not elsewhere classified*
 - ▶ Used in some coding systems to create a code for cases where specific details to further classify the idea being coded have been provided, but a more detailed code is not available

Best Practices

- Explore what happens to the meaning of these concepts when a new code is added in Year 2
- The meanings that the concepts encode change (NEC), or the statistical populations change (NOS), and yet the code will have stayed the same

Relationships

- **Hierarchical coding systems** support IS-A relationships through hypernymy
 - For example: 410.9 Myocardial Infarction of Unspecified Site
IS-A 410 Myocardial Infarction
- **Ontological coding systems** support IS-A relationships through explicit relationship links and may support other kinds of relationships
 - Whole-part relationships (drug and ingredients, body parts)
 - Directionality/bilaterality (left/right)
 - Severity, onset, chronicity ...
- There may be a fixed set of relationships (for example, RxNORM)
- Set of relationships may itself be coded (for example, SNOMED-CT)

Human-to-Code Interface

- Some coding systems embed the position of the term in the code hierarchy
- ICD-9-CM
 - Chapters
 - 3-digit code
 - 1-2 digit suffix
 - Common patterns
- Health care provider taxonomy
 - Provider type (~2 digits)
 - Classification (~2 digits)
 - Specialty (5 digits)

001–139	Infectious disease/Infection
140–239	Tumor
240–278	Endocrine disease · Nutrition disorder · Inborn error of m
279	Immunodeficiency · Immunoproliferative disorder · Hype
280–289	Anemia · Coagulopathy
290–319	Mental disorder
320–359	Nervous system disease (CNS, PNS) · Neuromuscular c
360–389	Eye disease · Ear disease
390–459	Cardiovascular disease (Heart disease, Vascular disea
460–519	Respiratory disease (Obstructive lung disease, Restrict
520–579	Stomatognathic disease (Tooth disease) · Digestive dise
580–629	Urologic disease (Nephropathy, Urinary bladder diseas
630–679	Complications of pregnancy · Obstetric labor complicati
680–709	Skin disease · <i>skin appendages</i> (Nail disease, Hair dise
710–739	Musculoskeletal disorders: Myopathy · Arthropathy · Os
740–759	Congenital disorder (Congenital abnormality)
760–779	Fetal disease
780–799	Syndromes · Medical signs (Eponymous)
800–999	Bone fracture · Joint dislocation · Sprain · Strain · Sublu

Vocabulary-Based Interfaces

- Additional vocabulary
 - SNOMED CT used preferred and alternate terms
 - ICD-9-CM has an extensive index of synonyms
 - LOINC contains numerous alternate names
- Access to codes through synonyms requires a search index
- Many applications support search
- Terminology services provide programmatic access to search
