## Lecture 5f: Practice Problems

---

John McGready  
Johns Hopkins University

# Practice Problems

1. A health policy researcher is doing an ad-hoc study of gender differences in attitudes about medical confidentiality. He spends some time at a shopping mall and polls and asks individuals to rate their degree of agreement for a statement related to confidentiality using the following five-point scale:

Strongly disagree	1
Disagree	2
Neutral	3
Agree	4
Strongly agree	5

# Practice Problems

- Responses are coded from 1 to 5
- At the end of his tenure at the mall, this researcher has a total of 11 respondents: 6 male, 5 female
- The distribution of responses is as follows:

— M	1	3	4	2	3	5
— F	3	4	4	3	5	

# Practice Problems

- Despite the small sample size, the researchers is interested in testing for a difference in degree of agreement for males compared to females
  - a) How could he do this using the ranks of the data values?
  - b) Compute the average rank for each gender group
