Lecture 3h: Practice Problems

John McGready
Johns Hopkins University

Practice Problems

1. In a study of patients hospitalized after myocardial infarction and treated with streptokinase, 2 of 15 patients died within 12 months.
 - a) Calculate by hand an approximate 95% CI for the one-year mortality rate (proportion) using the CLT based approach
 - b) How does the interval in part a compare to the exact interval estimated by Stata?

Practice Problems

2. Devise a one sentence “recipe” for calculating an approximate 95% CI for a parameter, whether it be a proportion or a mean (assume a large sample) using the results from a single random sample.
