Lecture 2a: Practice Problems

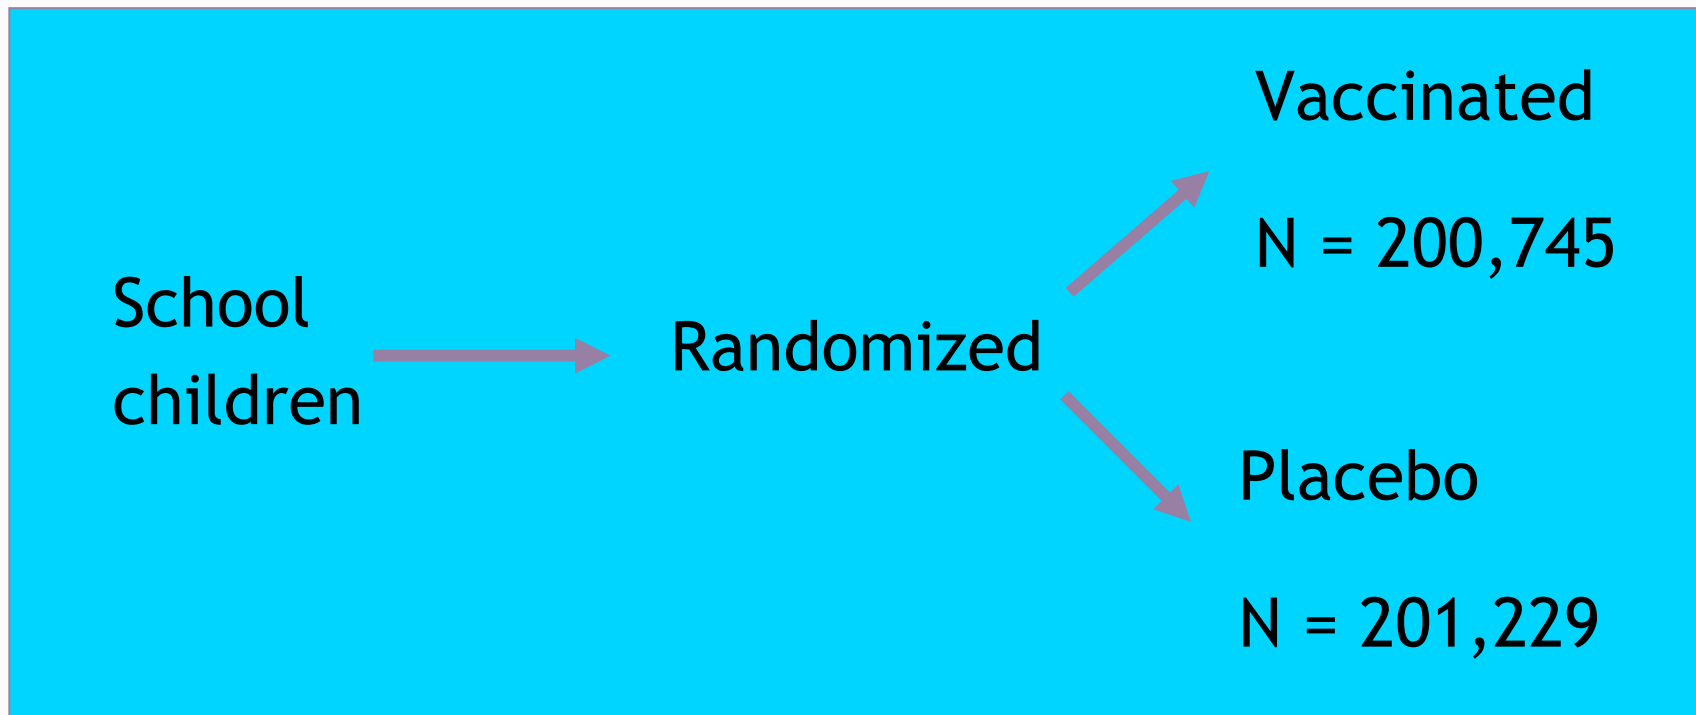

John McGready
Johns Hopkins University

Practice Problems

1. Can you explain confounding to a classmate or other acquaintance?
Can you think of an example to help with your explanation?

Practice Problems

2. Consider a large, randomized study such as the Salk polio vaccine trial

Practice Problems

2. How does randomization help to ensure that the outcome /treatment group relationship observed is not confounded by any factors known or unknown? More specifically, what part of the necessary conditions for confounding does randomization eliminate?

Practice Problems

3. Suppose a study were performed to assess the relationship between a diet choice (vegan, lacto-ovo vegetarian, neither) and cholesterol level. Subjects were not randomized to a dietary group. Before interpreting the relationship, can you name some potential factors for which it would be advisable to control?
